## **Measuring Angles with a Protractor**

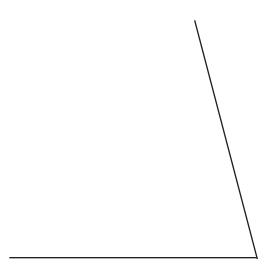

Activity 2. Measuring angles with the scale that goes left to right

The following angles are easier to measure if we make the  $0^\circ$  mark on the left of the protractor coincide with the horizontal leg of the angle. Notice the scale going from  $0^\circ$  on the left to  $90^\circ$  on the top, and then continuing to  $180^\circ$  on the right. If you are measuring an angle smaller than a right angle, the measure should be less than  $90^\circ$  (angles less than a right angle are called acute angles). If you are measuring an angle bigger than a right angle, then you should get a measure bigger than  $90^\circ$  (these angles are called obtuse angles).
